Trusted Sources

This project can call its own protected deployments within the same environment by default. Add other projects in your team, or external services that present an [OIDC token](#), to also access this project's protected deployments. Requests authenticate by forwarding the calling identity's OIDC token on the `x-vercel-trusted-oidc-idp-token` header.

Protection Bypass for Automation

Let automation services access this project's protected deployments. To bypass Deployment Protection, send the `x-vercel-protection-bypass` header or query parameter with any value below. Designate one secret as the `VERCEL_AUTOMATION_BYPASS_SECRET` system environment variable to make it available to all deployments.

Add a secret that can be used to bypass Deployment Protection for this project.

Add Secret

Shareable Links

Give collaborators outside your Vercel team access to protected deployments.

Create, revoke, or regenerate links for any deployment's up-to-date URL from the Share button on a project's deployment page, or from the toolbar on a Preview deployment. Shareable Links bypass Vercel Authentication, Password Protection, and Trusted IPs when those features are enabled.

OPTIONS Allowlist

Specify paths where OPTIONS requests bypass

deployment protection. This allows [CORS preflight](#) requests, which browsers send without authentication. Any OPTIONS request whose path starts with a listed prefix bypasses protection.
